IGOR

The modest video control room for people who “bring home” events every day

Countdown, teleprompter, scrolling text banner, video playback, capture devices and NDI sources, composed together and sent full screen to a second monitor.

- Timer
- TelePrompt
- Text banner
- Scenes · CUT · FADE
- NDI in and out
- MIDI · Stream Deck
- Phone remote
- 6 languages

Free · Windows and Mac · igorcountdown.com

software by **MyWebTvLive.com**

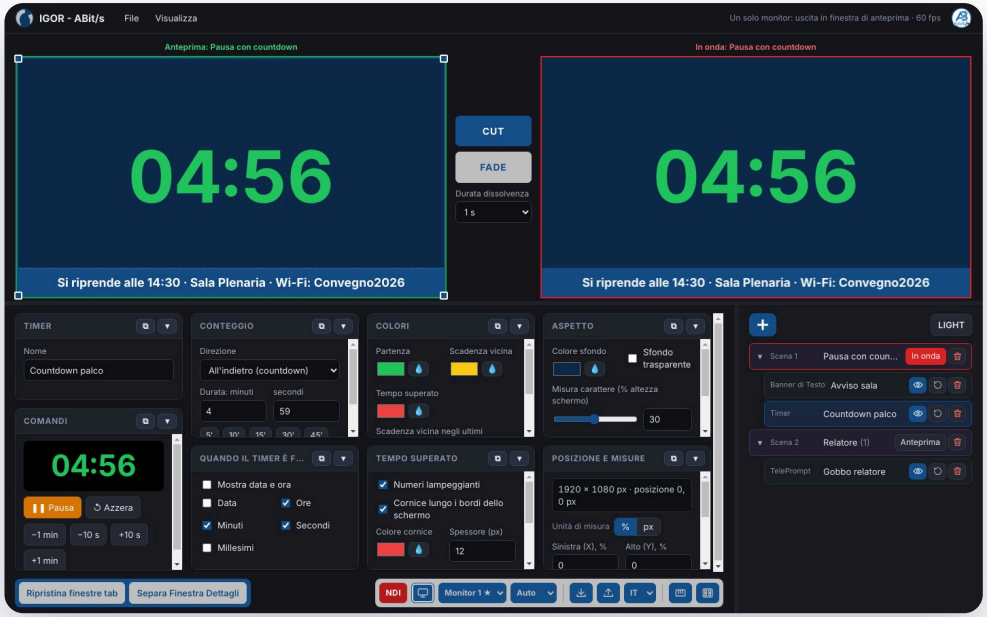

WHY IT EXISTS

When the computer in the control room doesn’t have what you need

It happens to everyone: you didn’t follow the setup, and when you walk into the room on the morning of the event, nothing you need is there! The speakers want a countdown, or PowerPoint’s presenter view. The host wants a prompter, the client asks for their logo on screen, and maybe there’s also an NDI feed to send to a confidence monitor backstage.

That would take three or four different programs to install, configure and get working together.

IGOR tries to make your day a little lighter by putting all of this in one place. It doesn’t want to replace a real vision mixer or a full playout suite like vMix: it wants to be the lightweight tool you open on the spot when you need something a bit more advanced than a plain countdown or a plain teleprompter.

IGOR’s control window in studio mode: the next scene in preview on the left, what is on air on the right.

HOW IT WORKS

Two windows: content control and on-air output

Control

On the main monitor you add elements, move and resize them with the mouse in the preview, and decide what goes on air.

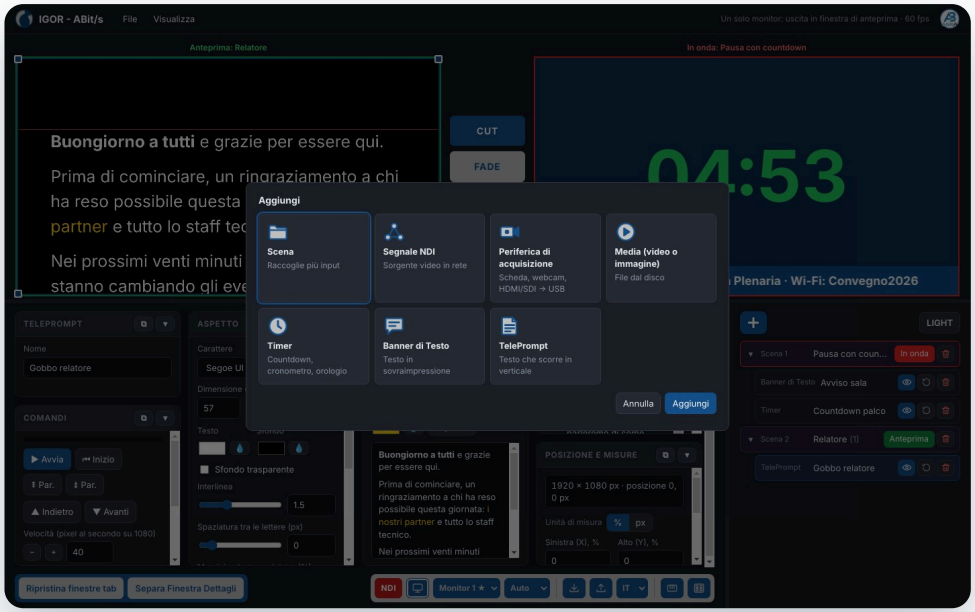

Output

Full screen on the second monitor, with control over frame rate and output quality for when you need higher quality.

Scenes, CUT and FADE

A scene groups several elements, for example *countdown + banner* or *background + camera*. One scene is on air at a time, and whatever sits outside scenes (a logo, a banner) is always visible. The same element can be in several scenes using a single source: one camera, one NDI receiver.

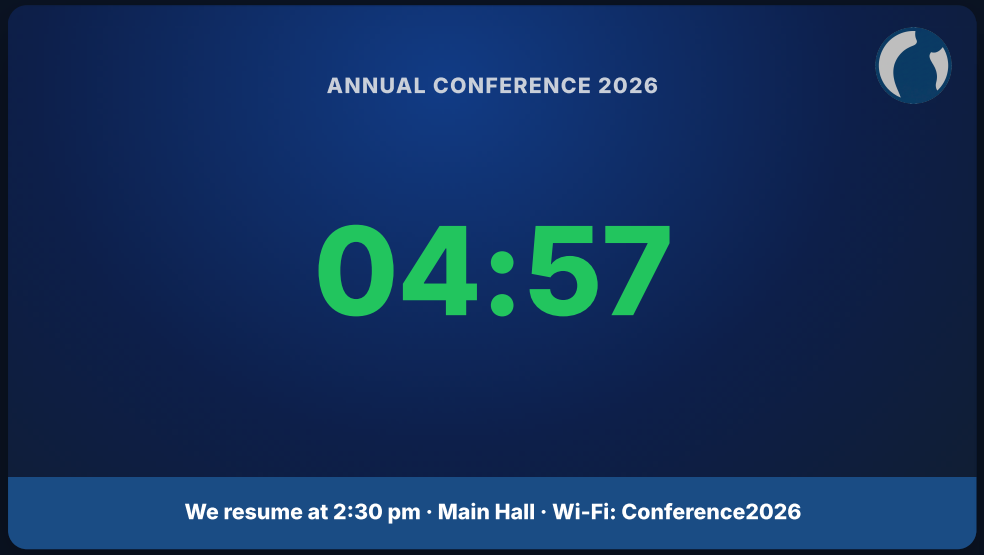

In **studio mode** you see preview and on-air output side by side, and switch with a hard cut or a dissolve.

The + button opens the list of elements: scene, NDI, capture device, media, timer, text banner, TelePrompt.

TIMER AND CLOCK

A countdown the speaker understands at a glance

While counting: green, then yellow as the end approaches.

- Count down or count up.
- Start, pause, reset, plus or minus 10 seconds and 1 minute, even while running.
- Three colours of your choice: start, ending soon, overtime.

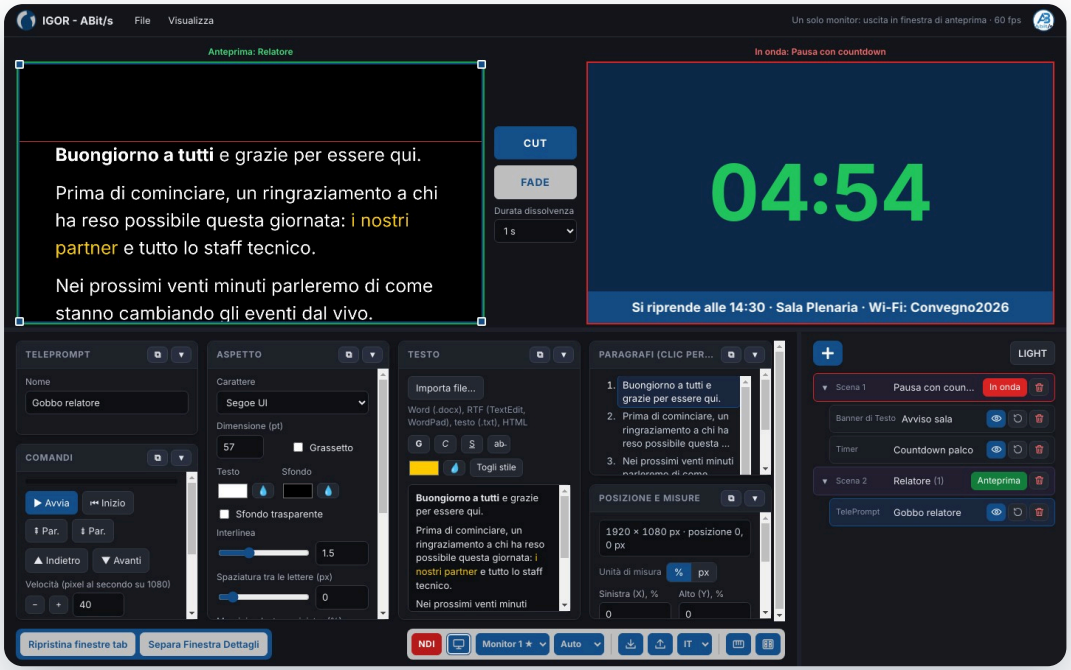

When time is up: red, a + sign, flashing digits and a frame around the edges.

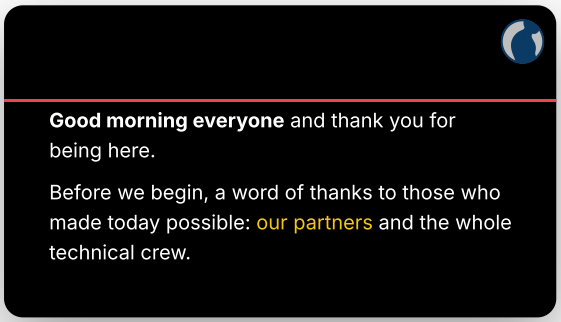

- Dashed or solid frame that runs, flashes or stays still.
- Sound signal at the end: built-in bell or any audio you choose.
- When the timer is stopped it can show a clock, with date, hours, minutes, seconds and milliseconds.

TELEPROMPT

The prompter, with no extra software

Studio mode: the speaker's prompter in preview, the break countdown on air.

On the output: what the speaker reads, with the red reading line.

- Text scrolls from bottom to top at the chosen speed, which you can change on the fly.
- Type it, paste it from Word, Pages, Notepad or TextEdit, or import **.docx**, **.rtf**, **.txt** and **.html** files. Bold, italics, colours and sizes are kept.
- Jump to paragraphs from a list or with Page Up and Page Down.
- Horizontal and vertical **mirroring** for teleprompter glass, a **reading line** with position and colour.
- Text size in points, like in text editors; line spacing, letter spacing, margins and alignment.
- It can pause by itself when it goes off air and resume when it comes back.

WHAT YOU CAN PUT IN

Everything you need on the big screen

Text banner

An overlay strip, usually at the bottom. If the text fits it stays still and centred; if it's longer it scrolls. Colours, transparency, speed and font as you like.

Video and images

mp4, webm, mov, mkv, png, jpg and more. Playback starts by itself and stops when the file is off air. Audio can follow the air state.

Webcam and capture

Anything the computer sees as a camera: webcams, capture cards, HDMI or SDI to USB converters.

NDI in

IGOR finds NDI sources on the network by itself. Full quality, or reduced to save bandwidth.

NDI out

With one click IGOR's output becomes an NDI source, "IGOR - ABit/s", to receive on another computer, a vision mixer or streaming software.

Free composition

Move and resize every element with the mouse, in pixels or percent. Cropping, fitting, layers from foreground to background, colour picker.

Light on resources

Video and animations are composited by the graphics card. If your computer can't deliver high performance, lower the output frame rate (down to 10 fps) or switch to **light mode**, which turns off scenes and studio mode without interrupting the output.

Take it from event to event

The setup is saved automatically and exports to an **.igor** file to open on another computer. On Windows there's also a portable version that runs without installing anything. Interface in Italian, English, Spanish, French, Chinese and Arabic.

REMOTE CONTROL

Your hands stay on the buttons

MIDI controllers

Choose a command, press **Learn** and touch a key, pad or knob: CUT, FADE, scenes, timer, video, TelePrompt (speed on a knob too), show or hide the output.

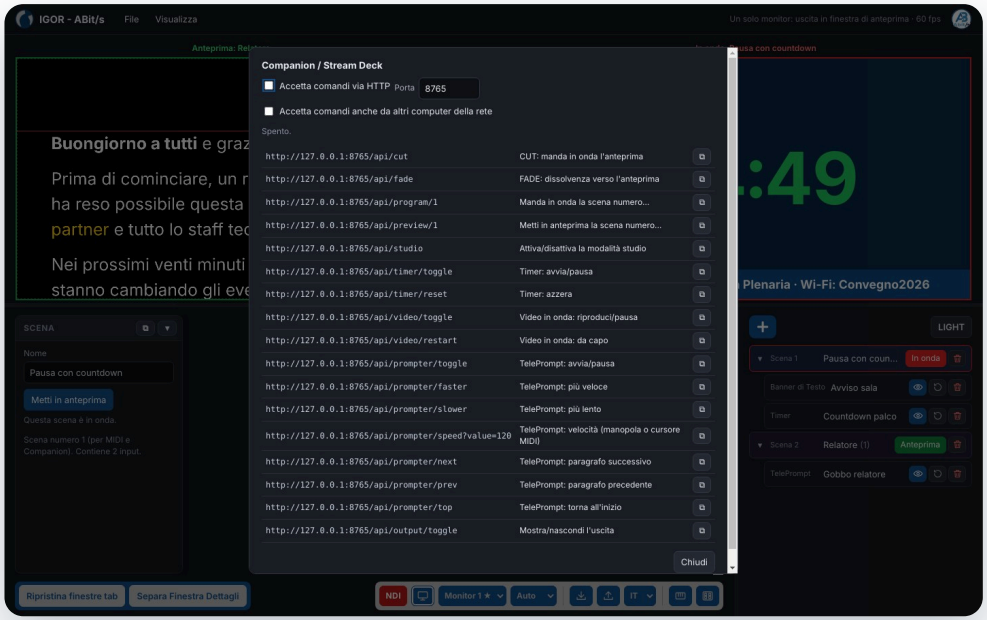

Companion and Stream Deck

The same commands become web addresses for Bitfocus Companion's *Generic HTTP* module, on this computer or another one on the network.

Phone remote and moderator page

Scan the QR code and run IGOR from a phone on the same Wi-Fi: scenes, CUT and FADE, inputs, timers and TelePrompt. A second QR code gives the moderator a tablet that shows only the timers and texts you choose.

A step-by-step guide is on GitHub, linked from the Download page.

The Companion / Stream Deck window with the list of commands.

HOW IT GREW

One version at a time

0.3.0 8 October 2026
First public release, for Windows: NDI, capture devices, timer and a scrolling sentence.

0.4.0 9 October
Reorganised control window, three-colour timer with + sign and frame, cropping with the mouse, video and images.

0.4.1 – 0.4.3 9–11 October
.igor configuration files, scenes and studio mode with CUT and FADE, TelePrompt, colour picker.

0.4.4 11 October
Menu bar, English interface, adjustable layout, clock in the timer, MIDI, Companion and Stream Deck.

0.4.5 · 0.4.7 11 October
Movable detail panels, single + button, NDI output, light mode, IGOR colours, quick guide.

0.4.8 – 0.4.10 11 October
Bottom control bar, multi-select, Companion guide, and IGOR arrives on Mac (Apple silicon and Intel).

0.4.11 12 October
TelePrompt reorganised with sizes in points, videos that follow the air state, tooltips on every button.

0.4.12 · 0.4.13 12 October
No more 25 fps limit: the output follows the monitor’s refresh rate. New two-colour icons.

0.4.14 – 0.4.18 12–19 October
Timer sound signal, video timeline, copy and paste, interface in six languages, phone remote and moderator page.

IGOR was born from an idea by **Andrea Battaglioli**, with the support of **Claude**, **Lorenzo Olivotto**, **Matteo Castaldo** and **Massimiliano Nardi**. Thank you.

WHO STARTED IT

Born in the control room, not in an office

My name is **Andrea Battaglioli** and I've worked in the events world for more than twenty years.

Over the years I've walked the whole road backwards: from organiser to catering, from porter to technical manager. I think it was the best school, because you only really understand an event once you've lived it from every perspective, including that of whoever unloads the van at six in the morning.

My professional work has always been tied to IT and events. In 2008 I started working on streaming, when broadcasting an event live was still something of a gamble. For about fifteen years I've also worked on networks for events with large crowds, integrating the existing infrastructure and facing a different challenge every time.

I see myself as halfway between an event technician and an IT technician, and that's exactly where IGOR comes from... with a little help from Claude :)

> Whoever is in the control room knows what's really needed in the room. Whoever is behind the computer tries to do it as simply and lightly as possible.

IGOR is free and its code is public. Many of its features came from colleagues who tried it and told me what was missing.

If you use it at an event, find something that doesn't work or have an idea, write to me. It's the best way to help it grow.

DOWNLOAD IGOR

Free, no sign-up

The latest version for Windows and Mac is always on

igorcountdown.com

or directly at github.com/battacharlie/MyGobbo/releases/latest

Windows · setup

Installs like any other program.

Windows · portable

Runs without installing: handy on a USB stick or a computer that isn't yours.

Mac · Apple silicon

M1, M2, M3 and later.

Mac · Intel

For older Macs.

You need a Windows or Mac computer, ideally with two screens: control on the main one, output on the second. NDI support is already included.

Questions, problems, ideas?
